

Desistance Section Source Sheet: Chapter 1, Section 4 (Expanded)

Focus: Chapter 1, Section 4 — Desistance from crime Purpose of this sheet: expanded practical source-and-quote bank for drafting the desistance section of the dissertation literature review. Primary base used: Literature_Notes_4---d57e6617-920b-4a13-b2cc-49891fb6eb36.txt, with the prior source sheet retained as the backbone and supplemented conservatively with additional empirical/open-access literature.

Use note: Quotes below come either from the notes file or from accessible open sources reviewed for this expansion. I did not invent quotes. Any quote used in the dissertation should still be checked against the final article PDF/page before submission.

Quick framing for the section

A strong organizing claim is that desistance is a layered, nonlinear process involving:

- 1 Primary desistance — a lull, slowing, or temporary cessation of offending behavior.
- 2 Secondary desistance — a change in self-concept, narrative identity, or cognitive orientation away from an offender identity.
- 3 Tertiary desistance — social recognition, belonging, reintegration, and acceptance within a broader community.

For this dissertation, that framing fits especially well because emerging adulthood is already a developmental period marked by identity exploration, unstable transitions, heightened peer influence, and uneven access to adult roles. A desistance-oriented residential model therefore needs to address behavior, identity, and social reintegration together.

1. Conceptualizing desistance

Core sources already carrying this section

Source 1

Citation: Maruna, S. (2003). Desistance from crime: A theoretical reformulation. [verify final publication details].

Why relevant: Foundational conceptual source for defining desistance as a process rather than a single terminal event.

Direct quote:

- From the notes: “The word desistance does not refer to a termination event that takes place at the time of a last offense. Desistance is the process of refraining or abstaining, from illegal behavior.”

Brief summary: Helps prevent the section from reducing desistance to simple recidivism/nonrecidivism counts.

Suggested use in writing: Use near the start to define desistance as an unfolding process.

Source 2

Citation: Maruna, S., & Farrall, S. (2004). Desistance from crime: A theoretical reformulation. [verify final publication details].

Why relevant: Best-known conceptual anchor for distinguishing primary and secondary desistance.

Direct quote:

- From the notes: "Maruna proposed 2 distinct phases of desistance: primary and secondary."
- From the notes: "The former refers to any lull of crime free gap in the course of a criminal career whereas the latter refers to the movement from the behavior of nonoffending to the assumption of the role or identity of a changed person."

Brief summary: Useful for showing that not offending and seeing oneself as changed are related but distinct processes.

Suggested use in writing: Use to justify why a desistance-oriented manual must target both behavior and identity.

Source 3

Citation: McNeill, F. (2015). Work on tertiary desistance/reintegration/belonging [verify exact source].

Why relevant: Key conceptual source for tertiary desistance.

Direct quote:

- From the notes: "Mcneill (2015) offered an additional phase called tertiary desistance, which involves not just shifts in behaviors or identity but shifts in ones sense of belonging to a community."
- From the notes: "Tertiary desistance is based on the assumption that society tolerates ex offenders."

Brief summary: Critical for arguing that lasting desistance is not only personal change but also social acceptance.

Suggested use in writing: Use to bridge from individual treatment goals to reintegration and community inclusion.

Source 4

Citation: Sagara, B., et al. (2024). Mapping desistance research: A systematic quantitative literature review from 2011 to 2020.

Why relevant: Recent synthesis of the desistance field and its uneven conceptual emphases.

Direct quote:

- “The variability in desistance research is attributed to differing operationalisations of desistance.”
- “In most studies primary desistance was the most frequently used, accounting for 79.6%, followed by secondary desistance 41.3% and tertiary desistance 4.6%.”
- “The dearth of tertiary desistance literature is partly because it is new relative to primary and secondary desistance.”

Brief summary: Strong support for arguing that the field still privileges behavioral cessation over identity and reintegration.

Suggested use in writing: Use as the main recent synthesis source on definition and measurement fragmentation.

Source 5

Citation: Massoglia, M., & Uggen, C. (2007). Subjective desistance and the transition to adulthood. *Journal of Contemporary Criminal Justice*, 23(1), 90–103. <https://pmc.ncbi.nlm.nih.gov/articles/PMC2441929/>

Why relevant: Strong empirical source on how desistance changes depending on how it is measured.

Direct quote:

- “This paper introduces two new conceptualizations of desistance based on individuals’ personal assessments of their own movement away from crime.”
- “The results indicate that the prevalence and the predictors of desistance vary with these alternative conceptualizations.”

Brief summary: Excellent evidence that operationalization decisions materially shape findings.

Suggested use in writing: Use in the measurement/limitations discussion and to support the emerging-adulthood angle.

Added source for this subsection

Source 6

Citation: Berzuini, C., Bianco, R., Paternoster, R., & others. (2015). Growing up is hard to do: An empirical evaluation of maturation and desistance. *Journal of Developmental and Life-Course Criminology*, 1(4), 350–384. <https://pmc.ncbi.nlm.nih.gov/articles/PMC5450969/>

Why relevant: Useful empirical bridge between broad desistance theory and the emerging-adulthood/developmental argument. It gives you another way to discuss primary desistance as tied to maturation across multiple domains rather than simple aging alone.

Direct quote:

- “In addition, a combined measure of maturation is related to crime, indicating that greater maturation through emerging adulthood has a negative effect on criminal behavior and is, therefore, a factor influencing desistance.”

Brief summary: This study examines multiple domains of maturation and finds that psychosocial, identity/cognitive, and adult-role development all matter for movement away from crime. It is helpful because it integrates competing desistance explanations instead of treating them as isolated.

Suggested use in writing: Use after defining desistance to argue that reductions in offending during emerging adulthood are linked to broader developmental maturation across identity, psychosocial functioning, and adult roles.

2. Factors that promote desistance

A strong synthesis here is that desistance is promoted by a combination of cognitive/identity change, social bonds, adult roles and opportunity structures, and engagement in effective treatment/support systems.

A. Identity shifts and cognitive transformation

Source 7

Citation: Giordano, P. C., Cernkovich, S. A., & Rudolph, J. L. (2002). Gender, crime, and desistance: Toward a theory of cognitive transformation. *American Journal of Sociology*, 107(4), 990–1064.

Why relevant: Classic cognitive transformation source.

Direct quote:

- No direct open quote pulled in this session; use as a major source and verify any exact language from the article.

Brief summary: Central for cognitive openness, hooks for change, and reinterpretation of the self.

Suggested use in writing: Use as a backbone source when discussing identity-focused intervention targets.

Source 8

Citation: Copp, J. E., Giordano, P. C., Longmore, M. A., & Manning, W. D. (2020). Desistance from crime during the transition to adulthood: The influence of parents, peers, and shifts in identity. *Journal of Research in Crime and Delinquency*, 57(3), 294–332. <https://pmc.ncbi.nlm.nih.gov/articles/PMC7946401/>

Why relevant: One of the strongest empirical sources for secondary desistance in emerging adulthood.

Direct quote:

- “Findings indicated that identity changes were associated with declines in offending.”

- “Cognitive processes are important to desistance. However, they do not independently provide a path to sustained behavioral change.”
- “Social experiences, including changes in relationships/supports from parents and affiliation with delinquent peers, also figure into change processes.”

Brief summary: Strong evidence that identity change matters, but does not operate alone; social relationships shape whether it stabilizes into behavior change.

Suggested use in writing: Use to argue that identity work and ecological support must be linked in a treatment model.

Source 9

Citation: Maruna, S. (2004). Desistance from crime and explanatory style: A new direction in the psychology of reform.

Why relevant: Connects desistance with narrative identity and explanatory style.

Direct quote:

- “Negative internal attributions are associated with persisting in criminal bx.”
- “One can speculate that the more individuals are able to attribute positive life events to broad, long lasting personal qualities, the greater the odds may be that they will be able to stay crime free.”

Brief summary: Useful for arguing that persistent offending may be reinforced by stable negative self-beliefs, while desistance may be helped by more agentic and hopeful self-interpretations.

Suggested use in writing: Use in support of self-story, meaning-making, and agency-focused intervention components.

Source 10

Citation: Doherty, E. E., Cwick, J., Green, K. M., & Ensminger, M. E. (2016). When onset meets desistance: Cognitive transformation and adolescent marijuana experimentation. *Journal of Developmental and Life-Course Criminology*, 2(2), 135–161. <https://pmc.ncbi.nlm.nih.gov/articles/PMC4966993/>

Why relevant: While focused on marijuana experimentation rather than crime broadly, this is a useful open-access empirical source showing how cognitive/perceptual updating differentiates persistence from cessation. It can be used cautiously as a supporting developmental analogue for early primary/secondary desistance processes.

Direct quote:

- “Desistance scholars primarily focus on changing social roles, cognitive transformations, and shifting identities to understand the cessation of serious crime and illicit drug use in adulthood.”
- “Experimenters had significantly lower updated perceptions of marijuana as a fun behavior compared to persisters and these perceptions dropped after the initiation wave.”

Brief summary: This study shows that persistence versus stopping can be partly explained by shifts in perceived rewards and meaning attached to the behavior. That is highly compatible with cognitive transformation approaches to desistance.

Suggested use in writing: Use sparingly as supplemental support that cognitive reappraisal of previously rewarding antisocial behavior may be part of early desistance processes.

B. Social bonds, family support, and peers

Source 11

Citation: Mowen, T. J., et al. (2018). A developmental perspective on reentry: understanding the causes and consequences of family conflict and peer delinquency during adolescence and emerging adulthood.

Why relevant: Strong source for relational context during reentry.

Direct quote:

- From the notes: "Post release social context matters more than past bx alone. Family conflict and peers independently increase offending even after controlling for prior offending."
- From the notes: "Strong post-release family support reduces family conflict and indirectly reduces peer delinquency and recidivism risk."

Brief summary: Shows that reentry context matters and that family conflict and delinquent peers are important persistence risks.

Suggested use in writing: Use to support family-based and peer-restructuring components in the proposed model.

Source 12

Citation: Matsueda, R. L. (2001). Differential association theory.

Why relevant: Theoretical mechanism for why peer context matters.

Direct quote:

- "Criminal behavior occurs when definitions favorable to crime outnumber or outweigh definitions unfavorable to crime."
- "Criminal behavior is most likely when individuals are deeply embedded in social networks that normalize, justify, or encourage law-breaking behavior."

Brief summary: Gives the theory base under the peer/desistance literature.

Suggested use in writing: Use to explain why peer network change is a desistance mechanism.

C. Employment, education, and adult-role transitions

Source 13

Citation: [Verify exact citation] Is emerging adulthood influencing Moffitt's developmental taxonomy? Adding the prolonged adolescent offender?

Why relevant: Strong developmental link between delayed adult roles and low-level offending in emerging adulthood.

Direct quote:

- "Prolonged adolescent offender: low level offender between the ages of 18 and 25 that has failed to successfully transition into adult social roles."
- "The # of hours worked per week were also a significant predictor of low-level offending, with those who worked more hours having lower levels of offending."
- "Economic instability was related to both low-level offending and drug use."

Brief summary: Helps frame low-level persistence as partly tied to blocked/delayed transition into adult roles.

Suggested use in writing: Use to support discussion of work, education, and economic stability as desistance-relevant developmental supports.

Source 14

Citation: Eitle, D., Turner, R. J., & others. (2010). General strain theory, persistence, and desistance among young adult male offenders. <https://pmc.ncbi.nlm.nih.gov/articles/PMC3076789/>

Why relevant: Connects strain reduction, coping, and desistance among young adults.

Direct quote:

- "GST suggests that desistance is more likely to occur among adults experiencing fewer negative events and negative relationships."
- "The core GST relationship b/w strain and crime was also found to be an important predictor of desistance from criminal bx."

Brief summary: Helps explain why reduced chronic stress, improved coping, and less exposure to negative relationships may support desistance.

Suggested use in writing: Use to diversify explanation beyond control and identity theories.

Source 15

Citation: Tripodi, S. J., Kim, J. S., & Bender, K. (2014). Which criminogenic need changes are most important in promoting desistance from crime and substance use? *Criminal Justice and Behavior*, 41(3), 276–299. <https://pmc.ncbi.nlm.nih.gov/articles/PMC4045616/>

Why relevant: Strong empirical source on dynamic change in criminogenic needs, especially work performance, family associations, and alcohol use.

Direct quote:

- “Probationers who had reductions in criminally involved family members they associate with, improved work performance, and decreased alcohol use had the greatest reductions in offending.”
- “These findings suggest that certain dynamic need changes may be more important than others, and designing interventions to impact these needs might improve outcomes.”

Brief summary: This study helps move the argument from static risk to changeable mechanisms tied to desistance. It is especially useful because it identifies specific need changes that were associated with reduced offending.

Suggested use in writing: Use to support intervention targets involving family ties, work functioning, and substance use reduction.

Source 16

Citation: Berg, M. T., & Huebner, B. M. (2018). Beyond the employment dichotomy: An examination of recidivism and days remaining in the community by post-release employment status. *International Journal of Offender Therapy and Comparative Criminology*, 63(5), 712–733.
<https://pmc.ncbi.nlm.nih.gov/articles/PMC6387636/>

Why relevant: Helpful corrective to simplistic “employed vs. unemployed” thinking in desistance/reentry work.

Direct quote:

- “Criminological research has tended to consider employment in a dichotomy of employed versus unemployed.”
- “Since employment has been found to be a vital resource in the reentry process at reducing recidivism, it is likely that the effects on recidivism vary by employment statuses in ways that have yet to be fully understood.”

Brief summary: This article supports a more nuanced view of employment as a desistance support. It suggests that employment quality/status and related barriers matter, not just whether someone technically has a job.

Suggested use in writing: Use in the limitations/methods discussion or in the employment subsection to avoid oversimplifying work as a binary protective factor.

Source 17

Citation: Duwe, G., & Clark, V. (2023). The effects of vocational education on recidivism and employment among individuals released before and during the COVID-19 pandemic.
<https://pmc.ncbi.nlm.nih.gov/articles/PMC10015282/>

Why relevant: Good supplemental source for employment/education because it adds nuance rather than overclaiming.

Direct quote:

- “Prior research shows employment is an important component of desistance, but there is mixed evidence regarding the effectiveness of prison-based education programs.”
- “It is recommended that career-focused educational programs incorporate the risk-needs-responsivity model and the continuum of care principle, build relationships with community employers, and assist with practical barriers to employment.”

Brief summary: This study is useful because it shows that vocational education is not automatically sufficient. It supports a more realistic argument that employment-related programming must be connected to continuity of care and concrete post-release barriers.

Suggested use in writing: Use when discussing employment/education as promising but not self-executing desistance supports.

D. Treatment engagement and structured support

Source 18

Citation: David, D. L., et al. (2016). Reducing recidivism and symptoms in emerging adults with serious mental health conditions and justice system involvement.

Why relevant: One of the few emerging-adult-specific intervention studies in the notes.

Direct quote:

- “There are really no established interventions with evidence of efficacy to reduce recidivism among emerging adults with or without SMHC.”
- “The specialized intervention group had better recidivism outcomes than the control group.”
- “The primary goal of MST-EA are to reduce recidivism and support positive functioning in school, work, independent living, and relationships.”

Brief summary: Supports cautious optimism regarding developmentally adapted intervention for emerging adults.

Suggested use in writing: Use as a key justification for the gap your dissertation addresses.

Source 19

Citation: Silva, M. J., et al. (2025). Effectiveness of Motivational Interviewing with justice-involved people: A systematic review and meta-analysis. <https://pmc.ncbi.nlm.nih.gov/articles/PMC12097221/>

Why relevant: Strong source on engagement, retention, motivation, and recidivism outcomes.

Direct quote:

- “When working with justice involved people, it is important to first increase their engagement in the process of change.”

- “Results from the meta-analysis indicated that MI was significantly more effective in reducing recidivism rates and increasing session attendance than interventions without MI.”

Brief summary: Especially relevant for a manual intended for clients who may be mandated, skeptical, or ambivalent.

Suggested use in writing: Use to justify MI-consistent engagement practices and ambivalence work.

3. Tertiary desistance, reintegration, and belonging

This subsection is especially important for your dissertation because a residential or correctional program should not stop at in-program compliance. It should aim toward recognition, inclusion, and durable community placement.

Source 20

Citation: McNeill, F. (2015). [verify exact source on tertiary desistance].

Why relevant: Core conceptual anchor for tertiary desistance.

Direct quote:

- From the notes: “Tertiary desistance is based on the assumption that society tolerates ex offenders.”

Brief summary: Helps frame reintegration as a social process, not merely personal reform.

Suggested use in writing: Use as the conceptual opening for this subsection.

Source 21

Citation: [Authors as listed in notes] Elements of successful desistance signaling. [verify final citation].

Why relevant: Useful for linking desistance to restoration of citizenship and social recognition.

Direct quote:

- From the notes: “Rehabilitation refers to the restoration of the person’s reputation and full citizenship.”
- From the notes: “Recent research estimates that approximately two thirds of ex prisoners remain unemployed for up to 3 years after their release from prison suggesting that the difficulties of prisoner reintegration are social and structural in nature as much as they are internal.”

Brief summary: Helps support the point that reintegration barriers are not just intrapsychic; they are structural and symbolic.

Suggested use in writing: Use when arguing that programs must address reintegration barriers, not just individual deficits.

Source 22

Citation: Factors associated with successful reintegration for male offenders: A systematic narrative review with implicit causal model. (2022). <https://pmc.ncbi.nlm.nih.gov/articles/PMC9803884/>

Why relevant: Strong open-access reintegration review that complements tertiary desistance by focusing on post-release functioning and outcomes.

Direct quote:

- “Reintegration describes the experience of re-entering the community following a prison sentence, whereas desistance theories attempt to explain why people stop offending.”
- “Risk-Need-Responsivity–based interventions had the strongest evidence for reducing post-release offending.”

Brief summary: This review is useful because it distinguishes reintegration from desistance while still showing how closely they overlap in practice. It also supports the idea that community outcomes, barriers, and service continuity matter after release.

Suggested use in writing: Use to connect tertiary desistance to concrete reintegration outcomes such as housing, barriers, substance use, and post-release supports.

Source 23

Citation: “Can’t Use Old Keys to Open New Doors”: Relational desistance mechanisms within community violence interventions. (2025). <https://pmc.ncbi.nlm.nih.gov/articles/PMC12357993/>

Why relevant: Helpful newer empirical source on belonging, trust, relational support, and prosocial peer network replacement. It is especially useful for the spirit of tertiary desistance even though it comes from the community violence intervention literature.

Direct quote:

- “Outreach workers and participants form a unique relationship through which participants are buoyed by belonging to a new ‘family’.”
- “Participants acquire new skills and prosocial peer networks that help them navigate away from the streets.”
- “Together, these processes support at-risk individuals through what might be best understood as a social movement as opposed to an individualistic process of ‘corrections’ or reform.”

Brief summary: This study gives contemporary qualitative evidence that relational trust, belonging, and new prosocial networks may be active mechanisms of desistance-supporting change.

Suggested use in writing: Use as a modern empirical illustration of why belonging and relational credibility matter, especially for tertiary desistance.

4. Gender and age considerations in desistance

Source 24

Citation: Rice, S. M., et al. (2023). Unmet mental health and criminogenic needs among justice-involved young people: A role for clinicians in the community.

Why relevant: Strong developmental and gender-responsive framing source.

Direct quote:

- “The onset of puberty (10-12) marks the commencement of a distinct developmental period that extends to around age 25 years...”
- “Many justice involved young ppl living in the community fall through systemic cracks, often magnified by the mismatch b/w developmental (10-25) and legal definitions of this population.”
- “With girls, a history of trauma is more common, warranting trauma-informed care and interventions promoting positive social relationships.”

Brief summary: Strong support for treating justice-involved young people as a distinct developmental population and for gender-responsive care.

Suggested use in writing: Use to justify developmental tailoring and trauma-informed, gender-sensitive design.

Source 25

Citation: Denny, J., Connor, D., et al. (2016). Serious juvenile offenders who have experienced emerging adulthood: Substance use and recidivism. [verify final citation].

Why relevant: Useful developmental framing source tied directly to ages 18–25.

Direct quote:

- “Emerging adulthood: refers to a finite period of time, approximately b/w 18-25 years old...”
- “Age of identity exploration.”
- “Age of instability.”
- “Age of feeling in-between.”
- “Age of possibilities.”

Brief summary: Supports the claim that emerging adulthood should not be collapsed into either adolescence or mature adulthood.

Suggested use in writing: Use as a developmental justification for age-specific intervention.

5. Empirical studies on desistance interventions and rehabilitation

Source 26

Citation: Lipsey, M. W., & Cullen, F. T. (2007). The effectiveness of correctional rehabilitation: A review of systematic reviews.

Why relevant: Broad rehabilitation anchor.

Direct quote:

- “Prominent literature supports the conclusion that punishment has little or no effect on recidivism.”
- “Overall, what research is available now firmly establishes the general point that rehabilitation works.”
- “The most important task for the next generation of research is to address the question of when, why, and for whom it works best.”

Brief summary: Strong support for a rehabilitation rather than punishment orientation, while leaving room for nuance.

Suggested use in writing: Use to justify rehabilitation broadly and your more specific intervention focus narrowly.

Source 27

Citation: Cullen, F. T. Correctional rehabilitation. [verify exact source].

Why relevant: Connects desistance literature to broader rehabilitation philosophy.

Direct quote:

- “The challenge remains to implement evidence based treatment practices and more broadly, to create legal processes that afford offenders the opportunity to earn true redemption and thus escape the burdens of a criminal record.”
- “Interventions that are therapeutic and emphasize a human service approach are most likely to achieve substantial reductions in recidivism.”

Brief summary: Helpful for framing the dissertation’s manual as humane, evidence-oriented, and reintegration-minded.

Suggested use in writing: Use when connecting theory to practical rehabilitation design.

Source 28

Citation: Andrews, D. A., Bonta, J., & colleagues. Psychology of Criminal Conduct / RNR sources [verify exact edition/source].

Why relevant: Empirical backbone for structured intervention principles.

Direct quote:

- “More precisely, higher risk offenders need more intensive and extensive services if we are to hope for a significant reduction in recidivism. For the low risk offender, minimal or even no intervention is sufficient.”

- “One should use social learning and cognitive behavioral styles of service to bring about change.”

Brief summary: Useful for grounding the desistance-oriented model in evidence-based correctional principles rather than abstract aspiration alone.

Suggested use in writing: Use to show that a desistance-oriented manual can still be tightly aligned with RNR.

6. Limitations in the current desistance literature

A. Definition and measurement problems

Source 29

Citation: Robertson, A. A., et al. (2022). Recidivism Among Justice-Involved Youth: Findings From JJ-TRIALS.

Why relevant: Clear language on recidivism inconsistency.

Direct quote:

- “Measuring and reporting recidivism is vital... yet no consensus exists with respect to defining recidivism or the length of follow-up period for determining occurrences of recidivism.”
- “The definition, the length of the tracking period, and youth characteristics used influence recidivism rates differently.”

Brief summary: Important because recidivism is often treated as shorthand for failed desistance.

Suggested use in writing: Use to connect desistance measurement problems to broader justice-outcome measurement problems.

Source 30

Citation: Sagara, B., et al. (2024). Mapping desistance research.

Why relevant: Best recent synthesis of conceptual fragmentation.

Direct quote:

- “The increasing volume of literature on desistance... has also led to variability in desistance research, causing problems in grasping a comprehensive picture of the desistance literature.”

Brief summary: Helps support the claim that the field still lacks a settled conceptual core.

Suggested use in writing: Use in the limitations section and in the overall gap statement.

B. Limited evidence specific to emerging adults in correctional settings

Source 31

Citation: David, D. L., et al. (2016). Reducing recidivism and symptoms in emerging adults with serious mental health conditions and justice system involvement.

Why relevant: One of the cleanest gap statements for your dissertation.

Direct quote:

- “There are really no established interventions with evidence of efficacy to reduce recidivism among emerging adults with or without SMHC.”
- “All current approaches to curb recidivism have moderate effects on recidivism, but the efficacy of these approaches specifically with emerging adults is either unknown or less potent.”

Brief summary: Directly supports the need for an emerging-adult-specific correctional/residential intervention framework.

Suggested use in writing: Use near the end of the section to justify the dissertation gap.

C. Theory-practice integration remains incomplete

Source 32

Citation: Ward, T. (2020). Why theory matters in correctional psychology: Theoretical illiteracy and therapeutic ineffectiveness.

Why relevant: Sharp critique of relying on predictive models without explanatory depth.

Direct quote:

- “A legacy of this lack of attention to a deeper theoretical analysis of dynamic risk factors is that we are not sure exactly HOW therapy is contributing to reduction in recidivism.”
- “Prediction has been mistaken for explanation.”
- “Treatment targets are often selected without demonstrating causal relevance.”

Brief summary: Supports the need for a theory-driven, integrated intervention model rather than a checklist of risk factors alone.

Suggested use in writing: Use to justify integrating desistance theory, developmental science, and correctional evidence.

Strongest expanded sources to lean on

If you want the most defensible expanded core set, I would lean hardest on:

- 1 Maruna / Maruna & Farrall — desistance as process; primary and secondary desistance.
- 2 McNeill — tertiary desistance, belonging, reintegration.
- 3 Sagara et al. (2024) — current state of the field and conceptual fragmentation.
- 4 Massoglia & Uggen (2007) — subjective desistance and measurement problems.
- 5 Berzuini et al. (2015) — maturation across emerging adulthood as an integrative desistance explanation.
- 6 Copp et al. (2020) — identity change plus parent/peer context during transition to adulthood.
- 7 Tripodi et al. (2014) — concrete dynamic need changes tied to reduced offending.
- 8 Berg & Huebner (2018) — nuance on employment as a desistance/reentry factor.
- 9 David et al. (2016) — emerging-adult intervention gap and MST-EA promise.
- 10 Relational desistance/CVI article (2025) — belonging, trust, and new prosocial networks as mechanisms relevant to tertiary desistance.

Short note on what newly strengthened the section most

The new sources that most strengthened this section were:

- Berzuini et al. (2015) because it gives an empirical, developmental bridge between maturation and desistance in emerging adulthood.
- Tripodi et al. (2014) because it identifies specific dynamic changes—family associations, work performance, and alcohol use—that were linked to reduced offending.
- Berg & Huebner (2018) because it adds needed nuance to the employment/desistance discussion and avoids simplistic “job = desistance” claims.
- The 2025 relational desistance/CVI article because it gives concrete language around belonging, trust, and prosocial network replacement that fits tertiary desistance especially well.
