

EA Dissertation Source Sheet: Chapter 1, Section 3C–D

Focus: Chapter 1, Section 3 after part B Population: emerging adults / young adult offenders in residential and correctional settings Purpose of this sheet: practical source-and-quote bank for drafting Section C: criminogenic risk factors common to young adults and Section D: challenges in correctional environments for a dissertation on a desistance-focused manual for emerging adults.

Important use note: Quotes below are taken from Destynee's literature notes unless otherwise stated. Before final submission, verify page numbers and wording against the original full-text article/book where possible.

Section C. Criminogenic Risk Factors Common to Young Adults

Framing idea for this subsection

A clean way to write this section is to argue that emerging adults in justice settings carry a cluster of dynamic, developmentally salient criminogenic risks—especially substance misuse, antisocial peers, family conflict/dysfunction, trauma, unstable employment/economic instability, and weak prosocial supports. These risks matter because they are not just correlates of offending; they are also practical treatment targets for a desistance-oriented residential manual.

C1. Core criminogenic needs / RNR backbone

Source 1

Citation: Andrews, Bonta, & Hoge / Psychology of Criminal Conduct (notes from Ch. 2; exact edition/page to verify in full text).

Why relevant: This is your strongest conceptual anchor for Section C because it gives you the evidence-based language for criminogenic needs and explains why targeting dynamic risk factors is central to recidivism reduction.

Direct quote(s):

- “Criminogenic needs are a subset of an offenders risk level.”
- “They are dynamic risk factors, when changes, are associated with changes in the probability of recidivism.”
- “Criminogenic needs are actually represented by the central 8.”
- “Increases in procriminal attitudes are associated with increased recidivism, and recidivism decreases when the offender holds fewer procriminal beliefs and attitudes.”

- “Many offenders, especially high risk offenders, have multiple needs. They ‘need’ places to live and work or they ‘need’ to stop taking drugs.”

Suggested use in writing: Use this source early in Section C to define the construct: young adults do not just present with general psychosocial problems; they often present with dynamic criminogenic needs that can be assessed and targeted. This gives you a bridge into substance dependence, family instability, antisocial peers, and unemployment.

How it supports the dissertation/manual: It justifies a manual built around modifiable targets rather than vague “support.” It also helps defend why a residential/correctional intervention for emerging adults should prioritize structured work on the needs most linked to recidivism.

C2. Substance use / substance dependence

Source 2

Citation: Denny, Connor, & Tewksbury (?) (2016). Serious Juvenile Offenders Who Have Experienced Emerging Adulthood: Substance Use and Recidivism. [verify full author list/title formatting].

Why relevant: This source is directly on the age range and ties substance use to continued justice involvement into emerging adulthood.

Direct quote(s):

- “Results indicate that users of specific substances have a higher overall likelihood of receipt of a subsequent arrest for different offense-types when compared to other substances.”
- “The use and abuse of alcohol and drugs also influence juvenile recidivism into adulthood.”
- “It has been estimated that as high as 78.4% of all teens who have contact with the juvenile justice system in some manner either tested positive for drugs, were under the influence and/or drugs when they committed their arrested offence, were arrested for an alcohol or drug offense, admitted substance use/addiction, or some combination of each factor.”
- “Further highlighting this need for study is that as high as 80% of violent juvenile offenders in some studies recidivate upon release from incarceration, while only 3.6% of juvenile offenders receive some form of substance use/abuse treatment.”
- “This topic is largely unexplored and this is where offenders make pivotal decisions whether to desist from or persist to use/abuse various substances, thus having the potential to influence continuance/desistance of criminal behaviors into adulthood.”

Suggested use in writing: Use this source to support a paragraph that substance use is not peripheral in this population—it is one of the most common and actionable recidivism-related needs. Also useful for arguing that treatment access is far below need.

How it supports the dissertation/manual: Supports including substance-use coping, relapse prevention, functional analysis, and motivational enhancement in the manual. It also helps justify why desistance work for emerging adults cannot ignore AOD issues.

Source 3

Citation: Syasyila et al. (2023). Psychosocial determinants of recidivism risk among incarcerated individuals with a history of substance use: A systematic review.

Why relevant: This gives a broader evidence base linking substance use with psychological distress, unstable environments, and recidivism. It is useful when you want to sound more synthesis-oriented rather than relying on a single age-specific study.

Direct quote(s):

- “Individuals w/ substance use histories continue to experience disturbingly high recidivism rates.”
- “Substance use increases the possibility of reoffending after release, even among those who do not fit the criteria for substance use disorders.”
- “Post-release substance usage has been associated with problems in social reintegration, raising the probability of recidivism.”
- “According to earlier studies, substance use frequently serves as a coping strategy when confronted with trauma or mental distress.”
- “Substance use has been shown to dramatically increase the risk of recidivism in 4 studies, especially when paired with exposure to unstable environments, criminal peer associations, or inadequate family support.”

Suggested use in writing: Use this source to show that substance use interacts with other risks rather than operating alone. Good for a paragraph on why treatment should be integrated and trauma-informed.

How it supports the dissertation/manual: Supports a manual that treats substance misuse as part of a broader psychosocial risk system, not as an isolated symptom.

C3. Antisocial peers / criminogenic networks

Source 4

Citation: Mowen et al. (2018). A developmental perspective on reentry: understanding the causes and consequences of family conflict and peer delinquency during adolescence and emerging adulthood.

Why relevant: This is one of the best sources in the notes for peer influence and post-release risk in a developmental frame.

Direct quote(s):

- “Research on adolescent development has repeatedly demonstrated that family conflict and peer deviance increase deviant and criminal behavior among adolescents.”
- “Bc peers are the most important social influence for a person b/w late childhood and early adulthood, we understand that adolescents bx are particularly susceptible to the behavioral patterns of their friends.”
- “Post release social context matters more than past bx alone. Family conflict and peers independently increase offending even after controlling for prior offending.”

- “Family conflict and delinquent peers are shared risk factors for criminal offending and substance use (peer effects are particularly strong).”
- “Interventions should prioritize family-based reentry programs, address family conflict immediately post-release, and target peer network restructuring.”

Suggested use in writing: Use this source for a paragraph on why emerging adults are especially vulnerable to antisocial peer influence during reentry and community transition. It also helps you move from risk-factor description into intervention logic.

How it supports the dissertation/manual: Directly supports including peer-network mapping, social support restructuring, and prosocial identity work in the proposed manual.

Source 5

Citation: Matsueda (2001). Differential Association Theory.

Why relevant: This is a strong theory support source for why peer influence matters. Use it to deepen the literature review rather than just listing peer deviance as an empirical correlate.

Direct quote(s):

- “Criminal behavior occurs when definitions favorable to crime outnumber or outweigh definitions unfavorable to crime.”
- “The article stresses that criminal behavior is most likely when individuals are deeply embedded in social networks that normalize, justify, or encourage law-breaking behavior.”

Suggested use in writing: Use this source to explain the mechanism behind peer influence: emerging adults may internalize pro-crime definitions through intimate group contact and reinforcement.

How it supports the dissertation/manual: Helps justify group-process attention, peer norms work, and cognitive restructuring around attitudes/beliefs that are socially reinforced.

C4. Family dysfunction / family conflict / weak prosocial bonds

Source 6

Citation: Mowen et al. (2018). A developmental perspective on reentry...

Why relevant: This source is also excellent for the family-conflict side of the risk picture.

Direct quote(s):

- “Children w/ high levels of family conflict, offend earlier in life, tend to offend more frequently and severely, and are likely to continue to offend as they transition into young adulthood.”
- “Family conflict has been shown to significantly related to elevated levels of depression, anxiety, and low self esteem among youth.”

- “Research demonstrates that family conflict creates negative mental health outcomes during reentry, interrupts family processes b/w the parent and child, and collectively places individuals at risk for reoffending.”
- “Strong post-release family support reduces family conflict and indirectly reduces peer delinquency and recidivism risk.”

Suggested use in writing: Use this source to argue that family is not simply a protective factor; dysfunctional family processes can also be criminogenic. That makes a good transition into trauma and attachment-related issues.

How it supports the dissertation/manual: Supports screening for family conflict, caregiver relationships, and social support quality. Also supports modules that help residents distinguish supportive vs. destabilizing relationships.

Source 7

Citation: Syasyila et al. (2023). Psychosocial determinants of recidivism risk...

Why relevant: This source strengthens the family/social support argument with review-level evidence.

Direct quote(s):

- “Social determinants such as familial support, parental criminality, and neighborhood disadvantage were consistently associated with recidivism risk.”
- “Higher levels of emotional support from family members were linked to lower recidivism rates and longer time between incarcerations.”
- “Even among individuals with strong emotional ties, reoffending happened when additional risk factors, including socioeconomic instability or unresolved psychological difficulties, were untreated.”
- “Family support may promote pro-social identity and service as a buffer against psychological strain.”

Suggested use in writing: Use this source when you want nuance: family support can be protective, but only when broader instability and psychological distress are also addressed.

How it supports the dissertation/manual: Supports a multi-level manual that includes family/social support planning but does not romanticize family involvement as automatically curative.

C5. Trauma / ACEs / mental health-related vulnerabilities that intersect with criminogenic risk

Source 8

Citation: Rice et al. (2023). Unmet mental health and criminogenic needs among justice involved young people: a role for clinicians in the community.

Why relevant: This is one of the best notes-based sources for trauma prevalence and the overlap between mental health needs and criminogenic vulnerability in justice-involved young people.

Direct quote(s):

- “Justice involved ppl are at increased risk of mental disorders relative to young ppl in the general pop.”
- “The relationship b/w mental illness and offending varies by disorder, with externalizing disorders being directly linked to offending, while internalizing disorder may contribute to offending indirectly by reducing access to protective factors such as social support and simultaneously increasing exposure to risk factors such as antisocial peers.”
- “JI young ppl experience an average of 3 ACE prior to their first arrest, necessitating trauma-informed practice.”
- “ACE can have an additive effect, with each additional event conferring an increased risk for a range of mental disorders, alcohol and other drug misuse, criminal activity, and subsequent recidivism.”

Suggested use in writing: Use this source in a paragraph arguing that trauma is not just “background history.” It is part of the developmental and clinical context that compounds criminogenic needs in emerging adults.

How it supports the dissertation/manual: Directly supports trauma-informed design features in the manual, especially for emotion regulation, coping, interpersonal mistrust, and treatment engagement.

Source 9

Citation: Carone et al. (2025). Trauma, defenses, and personality functioning in emerging adults.

Why relevant: This is especially useful if you want to connect trauma exposure to schema-level and personality-functioning problems in emerging adulthood.

Direct quote(s):

- “The multiple developmental challenges in identity and interpersonal domains that characterize emerging adulthood make this stage a critical juncture for the development of psychopathology.”
- “Abusive or neglectful experiences prior to the age of 18 years represent significant risk factors for developmental task failure, hindering subsequent adaptation.”
- “Such experiences may lead to maladaptive self-regulation and distorted self and other representations.”
- “Consequently, emerging adults with a history of childhood maltreatment may lack the necessary resources to navigate this life stage and stand at increased risk of developing psychopathology.”
- “Clinically, interventions targeting defensive functioning may help maltreated emerging adults develop healthier self- and interpersonal functioning, facilitating their adaptation to adulthood.”

Suggested use in writing: Use this source if you want to build a bridge from risk factors to the rationale for CBT + schema-focused intervention. It helps explain why trauma histories can show up as emotion dysregulation, maladaptive coping, and relational problems.

How it supports the dissertation/manual: Very strong support for a manual targeting underlying schemas, coping styles, and self/other representations rather than only surface behavior.

C6. Employment instability / economic strain / blocked adult-role transition

Source 10

Citation: "Is Emerging Adulthood Influencing Moffitt's Developmental Taxonomy? Adding the Prolonged Adolescent Offender?" [verify full citation].

Why relevant: This is one of your best notes-based sources for unemployment/economic instability and delayed transition into adult roles.

Direct quote(s):

- "Prolonged adolescent offender: low level offender between the ages of 18 and 25 that has failed to successfully transition into adult social roles."
- "The prolonged adolescent offender engages in crime and deviance because of failure to breach the maturity gap and achieve adult status, as symbolized by reaching the turning points of marriage, stable employment, and completion of higher educations."
- "The # of hours worked per week were also a significant predictor of low-level offending, with those who worked more hours having lower levels of offending."
- "Economic instability was related to both low-level offending and drug use, with those having higher level of economic instability having higher expected counts of both behaviors."
- "Parental attachment was a predictor of low-level offending with higher levels of parental attachment predicting a reduction in low level offending."

Suggested use in writing: Use this source to support the argument that unstable employment and delayed adult-role attainment are not just background stressors; they are part of the developmental context keeping some emerging adults stuck in persistent low-level offending.

How it supports the dissertation/manual: Supports adding vocational identity, future planning, and practical adult-role skill development into the manual, especially if your facility is residential and transition-focused.

Source 11

Citation: David et al. (2016). Reducing recidivism and symptoms in emerging adults with serious mental health conditions and justice system involvement.

Why relevant: This source provides a broader developmental consequences framing for justice involvement, including work and school disruption.

Direct quote(s):

- "Justice involvement can be a strong impediment to positive development. It is a strong predictor of school dropout, unemployment, low earnings, welfare dependence, and substance abuse problems in young adulthood."

- “Thus reducing recidivism in this high risk group with SMHC during the ages when offending becomes CRIMINAL rather than DELINQUENT, might significantly modify adult trajectories of offending and support more positive developmental outcomes.”

Suggested use in writing: Use this source to connect criminogenic needs with disrupted developmental tasks. Helpful for arguing that emerging adulthood is the window where intervention can still alter trajectory.

How it supports the dissertation/manual: Supports a manual that is not only about symptom reduction or rule compliance, but about promoting adult-role functioning tied to desistance.

Section C gaps in current notes

The notes are strongest on: substance use, peer influence, family conflict, trauma/ACEs, and employment/economic instability.

The notes are thinner on:

- Housing instability/homelessness specifically among emerging adults in correctional/residential transition
- Educational disengagement as its own criminogenic pathway for 18–26-year-olds
- Leisure/recreation deficits from the Central Eight, applied specifically to emerging adults
- Romantic relationship instability/IPV-related risk in young adult justice populations
- Direct prevalence data for these risk factors specifically inside residential correctional facilities serving 18–26-year-olds

Writing move: You do not need to force all Central Eight factors into this section. It is cleaner to foreground the risks best supported in your notes and briefly note that these factors cluster and interact.

Section D. Challenges in Correctional Environments

Framing idea for this subsection

A strong way to write Section D is to argue that even when young adults have treatable criminogenic needs, correctional environments often undermine desistance because they rely on punitive or generic approaches, provide insufficient developmentally tailored programming, struggle with implementation quality, and encounter resistance/engagement barriers among justice-involved clients.

D1. Punitive environments and the weak effects of sanctions alone

Source 12

Citation: Lipsey & Cullen (2007). The Effectiveness of Correctional Rehabilitation: A Review of Systematic Reviews.

Why relevant: This is a cornerstone source for showing that punishment and surveillance alone do not reliably reduce recidivism.

Direct quote(s):

- “Supervision and sanctions, at best, show modest mean reductions in recidivism and in some instances, have the opposite effect and increase reoffense rates.”
- “At present, much of what is done within corrections is not based on sound evidence but, rather, on custom, bureaucratic convenience, and political ideology.”
- “Prominent literature supports the conclusion that punishment has little or no effect on recidivism.”
- “The scared straight program and similar programs revealed that the intervention on average is more harmful to juveniles than doing nothing.”
- “Those sent to prison had higher recidivism rates than those placed on probation.”
- “In sum, research does not show that the aversive experience of receiving correctional sanctions greatly inhibits subsequent criminal behavior.”

Suggested use in writing: Use this source to open Section D. It gives you a broad, authoritative statement that correctional environments built primarily on control and punishment are not enough—and may sometimes worsen outcomes.

How it supports the dissertation/manual: Directly justifies why a desistance-oriented, psychologically informed manual is needed inside or alongside correctional settings.

Source 13

Citation: Cullen (2013/2020? verify year). Correctional Rehabilitation.

Why relevant: This source reinforces the argument that punitive interventions miss the actual “engines” of criminal behavior.

Direct quote(s):

- “Notably, this is one reason why scholars embracing rehabilitation predict that punitive interventions will have minimal effects: they do not target for change the engines of criminal bx—risk factors.”
- “Interventions that are punitive, that emphasize deterrence, discipline, or surveillance have weak, null, iatrogenic effects on recidivism.”
- “Interventions that are therapeutic and emphasize a human service approach are most likely to achieve substantial reductions in recidivism.”

Suggested use in writing: Use this source right after Lipsey & Cullen to pivot from critique to solution: correctional settings are most effective when they adopt a human-service and risk-targeted orientation.

How it supports the dissertation/manual: Provides direct conceptual support for a treatment manual focused on desistance, human service, and individualized change targets.

D2. Lack of developmentally responsive programming for emerging adults

Source 14

Citation: David et al. (2016). Reducing recidivism and symptoms in emerging adults with serious mental health conditions and justice system involvement.

Why relevant: This source is one of the clearest notes-based supports for the argument that emerging adults are underserved by interventions designed for adolescents or older adults.

Direct quote(s):

- “There are really no established interventions with evidence of efficacy to reduce recidivism among emerging adults with or without SMHC.”
- “All current approaches to curb recidivism have moderate effects on recidivism, but the efficacy of these approaches specifically with emerging adults is either unknown or less potent.”
- “In a study, the specialized intervention group had better recidivism outcomes than the control group, highlighting the potential utility of targeting emerging adults’ unique developmental challenges in the context of recidivism reduction approaches.”

Suggested use in writing: Use this source to explicitly support the age-responsivity problem: young adults are often managed in systems not tailored to their developmental stage.

How it supports the dissertation/manual: This is one of your best rationale sources for why a manual specifically for emerging adults is needed.

Source 15

Citation: Rice et al. (2023). Unmet mental health and criminogenic needs among justice involved young people: a role for clinicians in the community.

Why relevant: This source supports the argument that the system itself is mismatched to how this population develops.

Direct quote(s):

- “Many justice involved young ppl living in the community fall through systemic cracks, often magnified by the mismatch b/w developmental (10-25) and legal definitions of this population.”
- “Justice involved young ppl are less likely to engage with mental health services than young ppl who are not justice involved.”
- “Tx success will require close liaison and continuity of care with justice services and specialist mental health services as these young ppl reintegrate with their communities.”

Suggested use in writing: Use this source to explain that developmentally inappropriate service boundaries and fragmented systems are part of the challenge—not just individual pathology or noncompliance.

How it supports the dissertation/manual: Supports designing a manual that is developmentally responsive and coordinated with community reintegration goals.

D3. Research-to-practice gap / implementation failure inside corrections

Source 16

Citation: Lipsey & Cullen (2007). The Effectiveness of Correctional Rehabilitation: A Review of Systematic Reviews.

Why relevant: This is strong for showing that even when evidence exists, routine correctional practice often fails to deliver it well.

Direct quote(s):

- “The rehabilitation treatments generally found effective in research do not characterize current correctional practice, and bridging the gap b/w research and practice remains a significant challenge.”
- “It is a truism that a treatment that is not delivered cannot have effects.”
- “What is not so obvious is how poorly implemented, even in research studies, and how readily that compromises program effects.”
- “The most important task for the next generation of research is to address the question of when, why, and for whom it works best.”

Suggested use in writing: Use this source for a paragraph on implementation barriers: fidelity, dosage, staff training, and poor translation of evidence into routine settings.

How it supports the dissertation/manual: Supports building the manual with practical delivery guidance, structure, and fidelity considerations—not just content.

Source 17

Citation: Cullen. Correctional Rehabilitation.

Why relevant: This source gives you a concrete staffing/training problem.

Direct quote(s):

- “A recent survey of state departments of corrections reported that more than half train correctional officers in cognitive behavioral interventions and more than a third train them in the RNR model. However, an average officer receives less than 2.5 hours of training in each of these areas.”

Suggested use in writing: This is an excellent concrete detail to show that facilities may claim evidence-based practice while underinvesting in the staff competence needed to deliver it.

How it supports the dissertation/manual: Supports arguing for clear facilitator guidance, structured materials, and training expectations in any proposed program.

D4. Institutionalization, confinement, and reentry disruption

Source 18

Citation: Mowen et al. (2018). A developmental perspective on reentry...

Why relevant: This source is useful for showing that correctional placement itself creates a difficult reentry transition and identity challenge for young people.

Direct quote(s):

- “The period immediately following release when an adolescent returns home referred to reentry, presents a tremendous number of new challenges including creating post-incarceration identities and reestablishing ties with family and peer groups.”
- “85% of all adolescents who are placed into residential tx will be reincarcerated within 5 years.”
- “Clearly the system has struggled in this capacity as only 20% of programs in the Model Programs Guide were classified as being ‘effective.’”

Suggested use in writing: Use this source to write that confinement does not end at release; it creates a difficult developmental and social transition that many youth/young adults are not well supported through.

How it supports the dissertation/manual: Supports including identity transition, reentry planning, and relationship repair as core manual elements.

Source 19

Citation: Lipsey & Cullen (2007). The Effectiveness of Correctional Rehabilitation...

Why relevant: This is your best broad evidence that confinement itself can be counterproductive.

Direct quote(s):

- “Confinement tends to slightly increase recidivism.”
- “Imprisonment generally increases recidivism slightly.”
- “Placing ppl in custody tends to make them more likely to reoffend.”

Suggested use in writing: Use this source to back a cautious claim that confinement alone can have adverse or non-rehabilitative effects, which makes inside-facility programming even more important.

How it supports the dissertation/manual: Helps justify why residential settings need active desistance programming rather than passive containment.

D5. Treatment resistance, low motivation, and engagement barriers

Source 20

Citation: Silva et al. (2025). Effectiveness of Motivational Interviewing with justice-involved people: A systematic review and meta-analysis.

Why relevant: This is your best source for resistance to treatment and the need to address motivation directly.

Direct quote(s):

- “When working with justice involved people, it is important to first increase their engagement in the process of change.”
- “Justice involved ppl often approach intervention assessment with a lack of motivation to change and display argumentative behavior, impulsivity, and skepticism, and all of these factors can increase resistance to intervention and undermine its success.”
- “MI appears to be an effective tool for managing this resistance by avoiding confrontation and promoting opportunities to enhance participants’ intrinsic motivation.”
- “The main objectives in using MI in forensic practice are to promote engagement in the supervision process and to elicit and explore an individual’s own motivations for change regarding relevant criminal risk factors and life areas.”
- “Results from the meta-analysis indicated that MI was significantly more effective in reducing recidivism rates and increasing session attendance than interventions without MI.”

Suggested use in writing: Use this source for a paragraph on why correctional treatment often fails if it assumes motivation rather than building it. This is also a clean bridge into your integrated treatment rationale.

How it supports the dissertation/manual: Strong support for incorporating MI-consistent engagement strategies at the front end of the manual or throughout delivery.

Source 21

Citation: Syasyila et al. (2023). Psychosocial determinants of recidivism risk...

Why relevant: This source provides an additional engagement barrier from the substance-use/reentry literature.

Direct quote(s):

- “The risk was further increased by unmet psychological needs during reentry.”
- “Hepburn noted psychological barriers like low motivation or denial that decreased engagement even in the presence of services.”
- “These findings highlight the need for multi-level, coordinated approaches that target both more general psychological readiness and social weakness on individual basis.”

Suggested use in writing: Use this as a supporting citation that motivation problems in justice settings are not simply “attitude problems”; they are often tied to psychological distress, denial, and weak reentry supports.

How it supports the dissertation/manual: Supports readiness-building, motivational enhancement, and individualized planning.

D6. Theory and framework problems inside correctional treatment

Source 22

Citation: Ward (2020). Why theory matters in correctional psychology: theoretical illiteracy and therapeutic ineffectiveness.

Why relevant: This source helps you make a sharper doctoral-level argument: some correctional programming is weak not only because of implementation problems, but because it is conceptually thin.

Direct quote(s):

- “A legacy of this lack of attention to a deeper theoretical analysis of dynamic risk factors is that we are not sure exactly HOW therapy is contributing to reduction in recidivism and even when tx is effective, it does not appear to operate in the way we think.”
- “Prediction has been mistaken for explanation.”
- “Treating predictors as treatment targets without causal justification is a category error.”

Suggested use in writing: Use this source if you want to elevate Section D beyond surface-level institutional barriers and argue that correctional environments also struggle with weak theory-to-practice translation.

How it supports the dissertation/manual: Supports presenting your proposed manual as theory-driven and mechanism-aware, not just another generic program.

Section D gaps in current notes

The notes are strongest on:

- punitive vs. rehabilitative environments
- lack of age-responsive intervention evidence for emerging adults
- implementation/fidelity problems
- treatment engagement and motivation barriers
- reentry disruption following custody/residential placement

The notes are thinner on:

- classic prisonization/institutionalization literature specific to emerging adults
- direct qualitative accounts of how custody affects identity, autonomy, and developmental maturation among 18–26-year-olds
- staff burnout / turnover / safety climate in facilities serving young adults

- solitary confinement, coercive control, or disciplinary practices specifically for emerging adults
- racialized and gendered environmental harms inside correctional placements for 18–26-year-olds

If you later want to strengthen this section further, add only 2–3 targeted sources on: (1) prisonization/institutionalization, (2) developmentally appropriate young-adult custody programming, and (3) implementation barriers in correctional mental health treatment.

Short closing note: strongest sources for each section

Strongest sources for Section C

- 1 Psychology of Criminal Conduct (RNR / criminogenic needs chapters) — best backbone for defining criminogenic risk factors and why dynamic needs matter.
- 2 Mowen et al. (2018) — strongest for family conflict, peer delinquency, and reentry risk in a developmental frame.
- 3 Denny et al. (2016) — strongest age-relevant source for substance use and continued justice involvement into emerging adulthood.
- 4 Rice et al. (2023) — strongest for trauma/ACEs, mental health overlap, and unmet needs among justice-involved young people.
- 5 Prolonged adolescent offender article — strongest for unstable adult-role transition, economic instability, and employment-related risk.

Strongest sources for Section D

- 1 Lipsey & Cullen (2007) — best overall source for the limits of punishment, confinement, and poor implementation.
- 2 Cullen, Correctional Rehabilitation — strongest conceptual support for rehabilitation over punitive control and for the importance of targeting criminogenic risk factors.
- 3 David et al. (2016) — strongest direct rationale for age-specific intervention with emerging adults.
- 4 Silva et al. (2025) — strongest source for treatment resistance, low motivation, and why MI-consistent engagement matters.
- 5 Ward (2020) — best high-level source for arguing that effective correctional programming must be theory-driven, not just risk-labelled.
